Could someone verify if it does have a common wire and if all wiring could fit modern thermostats? I am still missing T and F. Trane units all use Blue as their 24 volt Common for their control circuits, Common is called this because all the 24 volt circuits return to Common to complete the 24 volt circuits. I found the manual online here: dar. Isn't B meant for a common wire? Otherwise without a 24 volt connection the the thermostat wouldn't work. At least as far as I understand the process. Check the wiring in the air handler, that will tell you definitively which wires are which. Add a comment. Active Oldest Votes. Improve this answer. Keith Grayson Keith Grayson 36 2 2 bronze badges. : Terminal - Wire color C - blue R - red Y - yellow E - brown G - green W2 - white O - orange On the Honeywell most things make sense, but the terminal configuration is a little different. There is no dedicated E or W2 terminal to put the current wires. But this leaves the E brown to hook up, so, really it seems I don't know which of these two wires to stick where. Any help or information would be appreciated. All wires appears to correspond to same-color wiring between units except for a blue wire that had been connected to "X" on the old unit. I concluded it must go to "E" emergency heat on the new one, but maybe that is wrong, since even the fan won't turn on, let alone the heat. It's like the programmable isn't there at all, though it appears to be otherwise functional. It does "click" when I turn things on, but that's apparently superficial. Had to hook the old one back up.
